

Financial Well-Being for Family Caregivers

Scoping Review

Financial interventions had a positive impact on psychosocial outcomes such as workplace productivity, caregiver burden, anxiety, and quality of life.

Grounded Theory

Family caregiving is an ecosystem of social norms, relationships, resources, roles, and competing demands. The family caregiving ecosystem is significantly threatened by having no social or financial safety net.

Survey

Perceived financial adequacy was a more significant correlate than income with workplace, mental, financial, and holistic well-being.

Financial well-being for family caregivers is complex and requires investigation and intervention at the individual, relational, and societal levels.
